Pravda bolí, protože nenadbíhá a nepochlebuje! Skutečná Pravda totiž zraňuje naši pýchu a domýšlivost, naše chyby a slabosti, náš egoizmus a ješitnost i naši hrdost na takzvané poznání. Pro toho, kdo nechce být rušený a znepokojovaný ve svém příjemném, ale bohužel smrtelném duchovním spánku, pro toho Pravda není!

[Benefits of Knowing More About Neutrinos Which Pass Through Our Bodies Unnoticed](#)

16. října 2015, 12:00

Bruce Mellado, University of the Witwatersrand | [The Epoch Times](#) | Science News

Článek přečten: 3 krát.

The observation that [neutrinos](#) have mass, which led to the 2015 Nobel Prize for Physics being awarded jointly to Japan's Takaaki Kajita and Canada's Arthur McDonald, is important for two key reasons. First, it provides a deeper knowledge of the fundamental tenets of nature. Second, as with any discovery, it comes with innovation in science and technology. While we know of the existence of neutrinos, not much is known about them. Neutrinos exist in huge numbers in the universe. That is why understanding neutrinos is directly relevant to our knowledge of the universe. Now that it has been established that neutrinos have [mass](#), we have a key to better understanding how mass is distributed in the universe. Neutrinos may also contribute to understanding why the universe is continuously expanding. It sits on the similar scale as the discovery of the [Higgs boson](#) at the [Large Hadron Collider](#) at European Organisation for Nuclear Research ([CERN](#)), and the future discoveries expected from the [Square Kilometre Array](#) (SKA) project. Any discovery in experimental science is the result of titanic efforts to overcome technological difficulties and challenges. When the neutrino was first [postulated](#) in 1930, many thought that it would be mission impossible to detect them, let alone to study its properties – such as its mass. The relentless need to understand nature better forces scientists to innovate with which to push the boundaries of science and technology. The efforts exerted to demonstrate that neutrinos contain mass have bolstered science and technology in [Canada](#) and [Japan](#). South Africa's [support](#) of projects at CERN, the SKA and other efforts already have a similar effect. Boosting science and technology via large scientific projects brings the added value of human capacity development in high technology that South Africa is in so much need of.

What Are Neutrinos?

Before answering this question we need to backtrack a bit. Matter is made of [atoms](#). Atoms are made of positively charged [nuclei](#) and negatively charged [electrons](#) travelling very fast around the nuclei. The electromagnetic force holds the electrons in orbit around the nuclei because opposite electric charges attract each other. Nuclei are very heavy compared to electrons and are composed of protons and neutrons. Neutrinos can be thought of cousins of the electrons, only neutral. Neutrinos share some of the properties of the electrons – for instance, the spin. There is one type of neutrino coupled to the electron, which is called electron neutrino. The electron has an anti-particle, the positron, which has positive electric charge. There is also an electron anti-neutrino. MORE:

- [How the Neutrino Could Solve Great Cosmic Mysteries and Win Its Next Nobel Prize](#)

In nature there are other charged particles that are similar to the electron, which are called muons and taus. These are heavier than the electron. The muons and taus also have two other types of neutrinos respectively. In total we are aware of three types of neutrinos (electron, muon, and tau) and their anti-particles.

Why Are Neutrinos Elusive?

Neutrinos do not have electric charge. Therefore, they do not get repelled or attracted to other charged particles in nature. They interact very weakly with matter so they very rarely leave a trace. Vast amounts of neutrinos [pass through us](#) every day, but we do not feel them because neutrinos hardly ever interact with the atoms that make up our bodies. Most of the neutrinos that pass through earth come from the sun and are produced by nuclear fusion. These are called solar neutrinos. The other neutrinos are produced as a result of the collision of cosmic particles with the Earth's atmosphere. These are called atmospheric neutrinos.

How Can We Tell That Neutrinos Have Mass?

There are three types of neutrinos. If neutrinos were massless then they would travel forever unencumbered. If neutrinos have mass then, as they travel, they gradually “disappear” to become a different type of neutrino. This is referred to as neutrino oscillation and it is a quantum mechanical effect. For instance, the Sun creates electron neutrinos. By the time neutrinos reach Earth we only observe about one-third of the emitted neutrinos. The remaining two-thirds of the electron neutrinos becomes muon and tau neutrinos. Through thi
